The following is a complete, marked up listing of revised claims with a status

identifier in parentheses, underlined text indicating insertions, and strikethrough and/or

double brackets indicating deletions.

Listing of the Claims

1. (Currently Amended) A hearing aid comprising, a housing and means for controlling an

operation mode of the hearing aid, characterised in that wherein said controlling means are

adapted to be responsive to a force applied to a part of an auricle of an ear of a hearing aid

user.

2. (Original) A hearing aid according to claim 1, wherein the housing is adapted to be placed

at a position behind the ear, and wherein the controlling means comprise sensing means

positioned on at least one side of the housing facing the head or facing the ear lobe of the

user, the sensing means being adapted to sense a force applied to the user's auricle, and the

controlling means being responsive to the sensing of the sensing means.

3. (Original) A hearing aid according to claim 1, wherein the housing is adapted to be placed

within an ear canal of the ear.

4. (Original) A hearing aid according to claim 3, wherein the controlling means comprise a

stiff lever having two ends, one of which is attached to a face part of the housing, the lever

being adapted to be deflected by application of the force to the auricle, such as a tragus, of the

ear, and the controlling means being responsive to the deflection of the lever.

Attorney Docket No. 45900-000569/US Application No. 09/787,945

5. (Original) A hearing aid according to claim 4, wherein the lever is adapted to also be used

by the user to remove the hearing aid from the ear canal.

6. (Original) A hearing aid according to the claim 5, wherein the level further comprises

engaging means adapted to facilitate engagement with the hearing aid during removal.

7. (Original) A hearing aid according to claim 6, wherein the engaging means comprises a

loop-shaped or hook-shaped part.

8. (Previously Presented) A hearing aid according to claim 4, wherein the controlling means

comprises switching means adapted to control the operation mode of the hearing aid, the

switching means being responsive to the deflection of the stiff lever.

9. (Original) A hearing aid according to claim 8, wherein the switching means comprises a

momentary switch.

10. (Original) A hearing according to claim 8, wherein the switching means comprises an

on/off switch.

11. (Currently Amended) A hearing aid according to claim 4, wherein the stiffness of the

lever is large enough to convey at least a pressure force of 5,0 5.0 Newton to the switch

element.

Attorney Docket No. 45900-000569/US

Application No. 09/787,945

12. (Currently Amended) A hearing aid according to claim 11, wherein the pressure force is

applied perpendicualrperpendicular to the length axis of the lever.

13. (Previously Presented) A hearing aid according to claim 9, wherein said switching means

are adapted to switch an electrical signal between two predetermined levels, the controlling

means being adapted to control the operation mode in response to a change in the electrical

signal level provided by the switching means.

14. (Previously Presented) A hearing aid according to claim 1, wherein the controlling means

are adapted to control a power on/off operation mode of the hearing aid.

15. (Previously Presented) A hearing aid according to claim 1, wherein the controlling means

are adapted to select a particular pre-set listening program between a number of pre-set

listening programs in the hearing aid.

16. (Previously Presented) A hearing aid according to claim 1, wherein the controlling means

are adapted to control a telecoil/microphone operation mode of the hearing aid.

17. (Previously Presented) A hearing aid according to claim 1, wherein the controlling means

further comprises an integrated circuit.

18. (Currently Amended) A hearing aid adapted to be positioned within an ear canal of an

ear of a user, the hearing aid comprising means for manually removing the hearing aid from

the canal, the removing means being fastened to the hearing aid and extending from the

hearing aid toward an auricle of the ear, eharacterized in that wherein the removing means comprise a stiff member adapted to remain in essentially the same predetermined position at least during normal deflection of said stiff member.
